Title: Perfect score: Sequence:

OM protein

Run on:

Scoring table:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Claim 1; Page 79-82; 116pp; English.

The present invention relates to human sel-10. The sel-10 proteins of the invention are useful for raising monoclonal or polyclonal antibodies useful in diagnostic assay for detecting sel-10 polypeptide expression. The sel-10 polymeptides are also useful as dritargets for decreasing antibody levels in the treatment of Alzheimer's disease. It is also useful for identifying agents capable of altering the production level of Abeta. The polymeclectides are useful for developing assays for identifying agents capable of interfering with the biological pathways that lead to Alzheimer's disease.

```
ö
This sequence represents a human sel-10 protein of the invention. This sequence is specifically a human mammary sel-10 protein. The polypeptides can be used to alter presentlin function. Compounds which inhibit either the expression or the activity of the human sel-10 polypeptides may reverse the effects of mutations to presentlin-1 (PS-1) or PS-2, and therefore may be useful for the prevention or treatment of Alzheimer's
                                                                                                                                                                                                              240
                                                                                                                                                                                                                                                                                                                             300

The present invention relates to human sel-10. The sel-10 proteins of the invention are useful for raising monoclonal or polyclonal antibodies useful in diagnostic assays for detecting sel-10 polypeptide sxpression. The sel-10 polypeptides are also useful as drug targets for decreasing antibody levels in the treatment of Alzheimer's disease. It is also useful for identifying agents capable of altering the production level of Abeta. The polynucleotides are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New human sel-10 polypeptides and their encoding polynucleotides, useful for raising antibodies for detecting sel-10 polypeptide expression and as drug targets in the treatment of Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                31 MKIFSISIIAQGLPFCRRRMKRKLDHGSEVRSFSLGKKPCKVSEYTSTTGLVPCSATPTT 90

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a human sel-10 protein of the invention. This sequence is specifically a human mammary sel-10 protein. The polypeptides can be used to alter presentlin function. Compounds which inhibit either the expression or the activity of the human sel-10 polypeptides may reverse the effects of mutations to presentlin-1 (PS-1) or PS-2, and therefore may be useful for the prevention or treatment of Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            150

                                                                                                                                                                  Human cDNA libraries from various tissues were screened for GTPase associated proteins (GTPAP). The present sequence is human GTPAP-29 protein. This sequence was derived from a cDNA library of brain tumour tissue. This protein is expressed in nervous, reproductive and gastrointestinal tissue. The GTPAP proteins may be used to define agonists and antagonists of GTPAP activity and to generate antibodies to GTPAP. This means the GTPAP proteins may be useful for treatment or prevention of diseases associated with GTPAP such as cell proliferation disorders, autoimmune disorders, atthma, inflammatory disorders, immune system disorders, cancer, AIDS, asthma, atherosclerosis, arthritis, systemic lupus erythematosus and psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  212

This sequence is specifically a human hippocampal sel-10 protein. The polypeptides can be used to alter presentlin function. Compounds which inhibit either the expression or the activity of the human sel-10 polypeptides may reverse the effects of mutations to presentlin-1 (PS-1) or PS-2, and therefore may be useful for the prevention or treatment of

This sequence represents a human sel-10 protein of the invention. This sequence is specifically a human mammary sel-10 protein. The polypeptides can be used to alter presentlin function. Compounds which inhibit either the expression or the activity of the human sel-10 polypeptides may reverse the effects of mutations to presentlin-1 (PS-1) or PS-2, and therefore may be useful for the prevention or treatment of Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MKRKLDHGSEVRSFSLGKKPCKVSEYTSTTGLVPCSATPTTFGDLRAANGQGQQRRRITS 109

The sel-10 polypeptides are also useful as drug targets for decreasing antibody levels in the treatment of Alzheimer's disease. It is also useful for identifying agents capable of altering the production level of Abeta. The polynucleotides are useful for developing assays for identifying agents capable of interfering with the biological pathways that lead to Alzheimer's disease.

              the invention are useful for raising monoclonal or polyclonal antibodies useful in diagnostic assays for detecting sel-10 polypeptide expression. The sel-10 polypeptides are also useful as drug targets for decreasing antibody levels in the treatment of Alzheimer's disease. It is also useful for identifying agents capable of altering the production level of Abeta. The polynucleotides are useful for developing assays for identifying agents capable of interfering with the biological pathways that lead to Alzheimer's disease.

(PS-1)
                       This sequence represents a human sel-10 protein of the invention. This sequence is specifically a human hippocampal sel-10 protein. The polypeptides can be used to alter presentlin function. Compounds which inhibit either the expression or the activity of the human sel-10 polypeptides may reverse the effects of mutations to presentlin-1 (PS-10 PP-2, and therefore may be useful for the prevention or treatment of Alzheimer's disease.
                                                                                                                                                                                                                                                                                                 289

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to human sel-10. The sel-10 proteins of the invention are useful for raising monoclonal or polyclonal antibodies useful in diagnostic assays for detecting sel-10 polypeptide expression. The sel-10 polypeptides are also useful as drug targets for decreasing antibody levels in the treatment of Alzheimer's disease. It is also useful for identifying agents capable of altering the production level of Abeta. The polynucleotides are useful for developing assays for identifying agents capable of interfering with the biological pathways that lead to Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                               New human sel-10 polypeptides and their encoding polynucleotides, useful for raising antibodies for detecting sel-10 polypeptide expression and as drug targets in the treatment of Alzheimer's disease

This sequence is specifically a human hippocampal sel-10 protein. The polypeptides can be used to alter presentlin function. Compounds which inhibit either the expression or the activity of the human sel-10 polypeptides may reverse the effects of mutations to presentlin-1 (PS-1) or PS-2, and therefore may be useful for the prevention or treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MKRKLDHGSEVRSFSLGKKPCKVSEYTSTTGLVPCSATPTTFGDLRAANGQGQRRRITS 109

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the invention are useful for raising monoclonal or polyclonal antibodies useful in diagnostic assays for detecting sel-10 polypeptide expression. The sel-10 polypeptides are also useful as drug targets for decreasing antibody levels in the treatment of Alzheimer's disease. It is also useful for identifying agents capable of altering the production level of Abeta. The polynucleotides are useful for developing assays for identifying agents capable of interfering with the biological pathways that lead to Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New human sel-10 polypeptides and their encoding polynucleotides, useful for raising antibodies for detecting sel-10 polypeptide expression and as drug targets in the treatment of Alzheimer's disease

       This sequence represents a human sel-10 protein of the invention. This sequence is specifically a human hippocampal sel-10 protein. The polypeptides can be used to alter presentlin function. Compounds which inhibit either the expression or the activity of the human sel-10 polypeptides may reverse the effects of mutations to presentlin-1 (PS-1) or PS-2, and therefore may be useful for the prevention or treatment of
                                                                                                                                                                                                169

                                                                                                                                                                              the present invention relates to human sel-10. The sel-10 proteins of the invention are useful for raising monoclonal or polyclonal antibodies useful in diagnostic assays for detecting sel-10 polypeptide expression. The sel-10 polypeptides are also useful as drug targets for decreasing antibody levels in the treatment of Alzheimer's disease. It is also useful for identifying agents capable of altering the production level of Abeta. The polynucleotides are useful for developing assays for identifying agents capable of interfering with the blological pathways that lead to Alzheimer's disease.
                                                                                             New human sel-10 polypeptides and their encoding polynucleotides, useful for raising antibodies for detecting sel-10 polypeptide expression and as drug targets in the treatment of Alzheimer's disease

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                               1 MSKPGKPTLNHGLVPVDLKS......SRNGTEETKLLVLDFDVDMK 589
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence (

C; Species: Ictalurus punctatus (channel catfish)
C; Accession: I45774
R; Ngai, J; Dowling, M.M.; Buck, L.; Axel, R.; Chess, A.
Cell 72, 657-666, 1993
A; Title: The family of genes encoding odorant receptors in the channel catfish.
A; Reference number: A45774; MUID:93201590
A; Reference number: A45774; MUID:93201590
A; Restaus: preliminary; not compared with conceptual translation
A; Molecule type: mRNA
A; Residues: I-344 <NGA>
A; Residues: I-344 <NGA>
C; Superimental source: olfactory epithelium
A; Note: sequence extracted from NCBI backbone (NCBIP:127744)
C; Superfamily: olfactory receptor OR14
C; Keywords: olfaction; transmembrane protein

A; Title: Sequence and analysis of chromosome I of the plant Arabidopsis.
A; Reference number: A86141; MUID:21016719
A; Accession: A86243
A; Status: preliminary
A; Molecule type: DNA
A; Residues: 1-821 <STO>
A; Residues: 1-821 <STO>
A; Residues: 1-821 <STO>

Natl. Acad. Sci. U.S.A. 87:7732-7736(1990).

-!- FUNCTION: MAY PLAY A ROLE IN INFLAMMATION AND EXERT ITS EFFECTS
ON ENDOTHELIAL CELLS IN AN AUTOCRINE FASHION.

-!- SIMILARITY: BELONGS TO THE INTERCRINE ALPHA FAMILY (SMALL CYTOKINE
C-X-C) (CHEMOKINE CXC).
                                                                                                                                                                                                                                                                                                                  01-FEB-1991 (Rel. 17, Created)

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
